THE BACK OFFICE GROWTH ENGINE:

Agentic AI Reinvents How CPG Handles Global Business Services

PRAVEEN KOMBIAL
SVP, Global Sales Head, EdgeVerve

Late on a Friday evening, while most of the staff has already left for the day, a regional supply chain manager at a global food brand is juggling a dozen spreadsheets, trying to reconcile an avalanche of distributor claims. He needs to check the ERP system to match orders and invoices, request proof of delivery, and finance terms to assess the payment status. What should've taken mere hours has dragged into a week-long exercise simply because the systems don't talk to each other.

For decades, this was the norm in Global Business Services (GBS). In fact, for much of its history, GBS has been the unsung, back-office engine of a ship – reliable, but largely hidden from view and driven by painstaking effort. In the Consumer Packaged Goods (CPG) industry, GBS began as a way to centralize tasks and reduce cost. Finance, HR, procurement, and order processing were consolidated into hubs that delivered scale, but not strategy. Success was measured by deterministic workflows that were undoubtedly valuable but limited in scale.

But today, the CPG enterprise is asking their GBS providers to do more: the mandate has expanded from efficiency to agility, from savings to revenue impact.

WHY AGENTIC AI CHANGES THE CURVE

Traditional automation tools codified the obvious; bots could process routine invoices or route basic tickets. But they broke down in the face of exceptions. Every deviation, from a missing proof of delivery to a mismatched unit price, triggered human intervention, creating bottlenecks that kept automation capped at roughly 40%.

Agentic AI alters this curve significantly. Instead of following static rules, agents can reason, collaborate, and access a more dynamic range of cognitive actions, only escalating to a human in the loop when all viable options are exhausted. This ability to work dynamically with both structured and unstructured data, and to continuously improve through feedback loops, is what makes the core difference.

From a technical standpoint, agents combine two core capabilities that deterministic tools lacked:

01

They can autonomously pull data from ERPs, CRMs, logistics systems, and even unstructured sources like emails or scanned documents, to build a much fuller picture before acting.

02

Using this data in concert with reasoning engines, machine learning programs and generative AI, agents can handle a much wider variety of exceptions, from reconciling invoices to resolving disputes by utilizing shipping data or cross-checking contract terms.

For CPG enterprises, this shift can have a dramatic impact on the growth levers of the business. Automation rates that were once capped at 40% are now routinely hitting 70-80% in live deployments. That means faster order-to-cash reconciliation, shorter settlement cycles, higher Net Promoter scores, and fewer lost sales from order delays or avoidable errors.

CRAFTING FRAGMENTED DATA INTO A STRATEGIC ASSET

McKinsey states that, "For CPG food and beverage enterprises with $10 billion in revenue, the potential gains on implementing digital and AI solutions could be approximately across the full value chain can be between $800 million and $1.6 billion, driven by both top-line growth and productivity gains."

So far, the critical barrier in CPG digital transformation hasn't been intent but integration. Enterprises have never lacked the will to modernize, but they've lacked a the ability to bring together data that is scattered across silos. Distributor claims, retailer sales, ERP records, procurement contracts, and supplier inputs all arrive in different formats, often through fragmented point solutions or worse, fragile spreadsheets stitched together with macros and manual updates. This fragmentation has turned data from a potential advantage into a liability, slowing down decision-making and forming a breeding ground for errors.

Rigid data uniformity is neither realistic nor scalable in CPG, but harmonizing heterogeneity is a much more viable alternative. The new playbook is to build configurable pipelines that can ingest, transform, and reconcile disparate data streams continuously, with each cycle sharply preserving the richness of each source. Unified platforms such as EdgeVerve AI Next paired with cloud-native infrastructure and data modernization kits have now made this more pragmatic approach possible at scale.

The Unified Platform Blueprint

What kind of components are platforms built with? Today's GBS hubs are converging on a four-layer stack. This is the foundation behind the unified platform approach and its ability to help enterprises create coherent insight in real-time from the deluge of incoming data.

Proof In Practice: Early Wins for AI In CPG

Orchestrating agentic AI via a unified platform within GBS allows CPG enterprises access to tangible proof of points that build confidence with the organization. Early deployments in high-volume, cross-system processes can demonstrate quick wins while laying the foundation for executive buy-in.

While the potential is there, this evolution also depends on embedding robust, guardrails and governance. Responsible AI frameworks, transparent decision lineage, and policy-driven oversight are the best way to build automation that scales compliant and stays compliant.

THE LEADERSHIP AGENDA TO CRAFT THE NEXT WITH AI

- Invest in a system of action for GBS, not just a system of record.
- Treat people as orchestrators and trainers of agents, instead of a purely execution layer.
- Anchor on high-volume, cross-system use cases where agentic AI proves value fast.
- Bake responsible guardrails into every deployment from day one.

Redefining the Core: GBS as a Strategic Growth Engine

Clearly the era of GBS as a below-deck efficiency engine is over. And the next chapter? GBS as a value office that drives agility, customer experience, and growth across the entire CPG enterprise.

Tomorrow's GBS hubs will run on their own system of action, complementing traditional systems of record. This system of action will give leaders real-time visibility into processes, bottlenecks, and outcomes.

GBS will also become a source of innovation and companies will work with tech partners to design a unified, AI-powered GBS platform tailored for their operations.

Finally, skills and culture will transform. Freed from repetitive grunt work, employees will make the shift to exception management, empathy-driven customer service, and AI stewardship.

The result is a GBS core that is not only more efficient but also strategically aligned with market-facing goals that are unique to the CPG industry.
